# Sensor Technologies

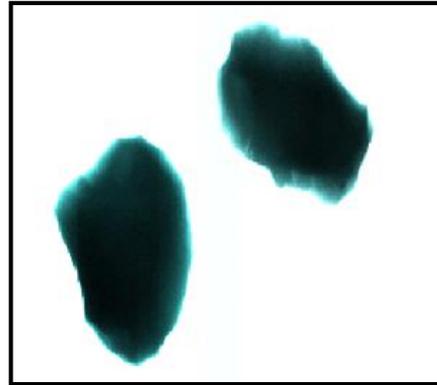

Wavelength [m]		Sensor/Technology	Material Property	Applications
<b>Gamma-radiation</b>		<b>RM</b> (Radiometric)	Natural Gamma Radiation	Fuel, Precious Metals
		<b>XRT</b> (X-ray transmission)	Atomic Density	Base Metals Precious Metals Industrial Minerals Fuel, Diamonds
<b>X-ray</b>		<b>ED-XRF</b> (Energy Dispersive XRF)	X-ray Fluorescence	Base Metals Precious Metals Industrial Minerals
		<b>XRF</b> (X-ray Fluorescence)	Visible Fluorescence under X-rays	Diamonds
<b>Visible light (VIS)</b>		<b>COLOR</b> (CCD Color Camera)	Reflection, Absorption, Transmission	Base-, Precious Metals Industrial Minerals Diamonds
		<b>PM</b> (Photometric)	Monochromatic Reflection/Absorption	Industrial Minerals Diamonds
<b>Near Infrared (NIR)</b>		<b>NIR</b> (Near Infrared Spectrometry)	Reflection, Absorption	Base metals Industrial Minerals
<b>Infrared (IR)</b>		<b>IR</b> (Infrared cam)	Heat conductivity, heat dissipation	Base Metals Industrial Minerals
<b>Radio waves</b>		<b>EM</b> (Electro-Magnetic sensor)	Conductivity, permeability	Base Metals

# Recovering Product from Dense Media Floats

- Customer's primary beneficiation process is Dense Media Separation.
- "Sinks" are high purity product which is denser than host rock.
- "Floats" contain waste rock. But since DMS makes a "fuzzy" cut. So to ensure high purity in the sinks, the floats inevitably contain a considerable amount of good product.
- Decades of processing have resulted in waste piles consisting of millions of tons of material, 25%-40% of which is good ore.

# Recovering Product from Dense Media Floats

- Rock-by-rock tests and subsequent bulk scale trials at TOMRA's test facility indicated that an XRT sorter could differentiate between valuable ore and waste rocks.
- Customer installed an XRT1200 sorter to process 60 t/h of ore pulled from waste piles.
- The sorter now recovers 25 t/h of high grade ore from the waste. That's over 150,000 tpa!

# There's Gold in Them Thar Hills!

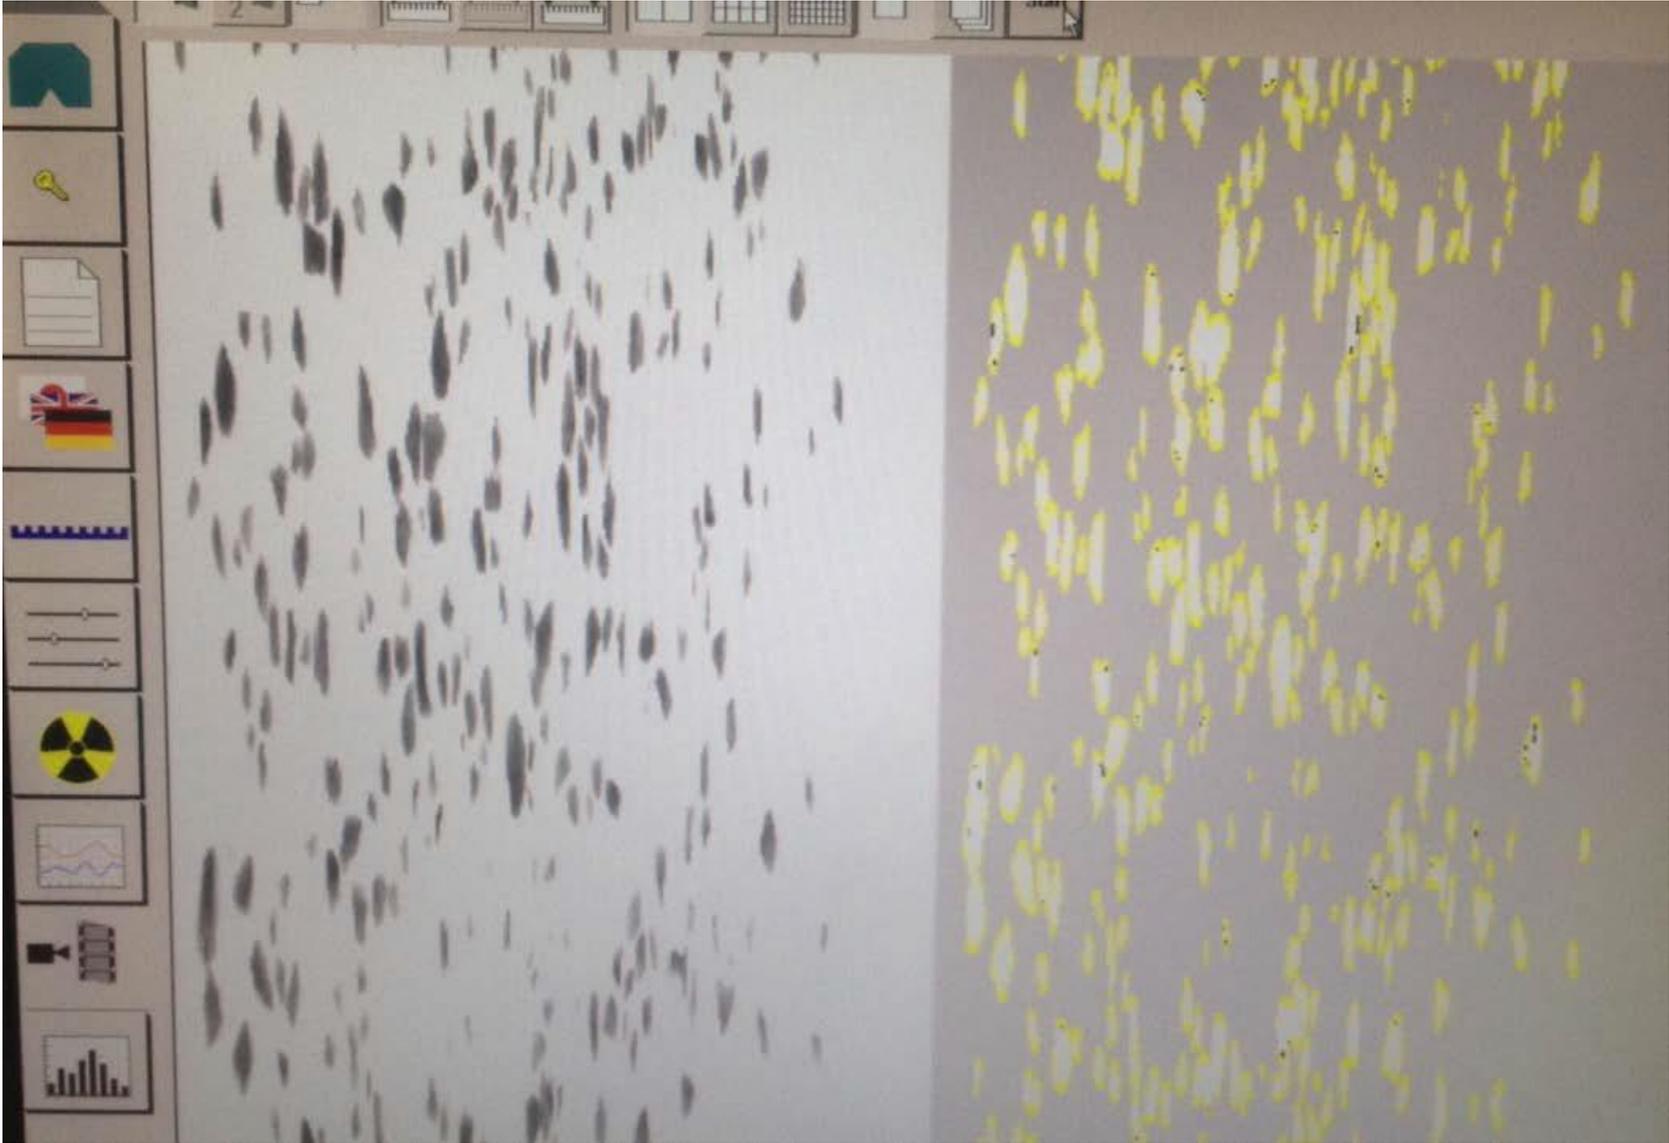

- Gold mine operation has found that harder rocks are less likely to contain gold. Because this rock is also more difficult to process, it's just not worth running it through the plant for the relatively low gold production that it would yield.
- So an initial separation is made to remove this harder rock which is then sent to a waste pile.

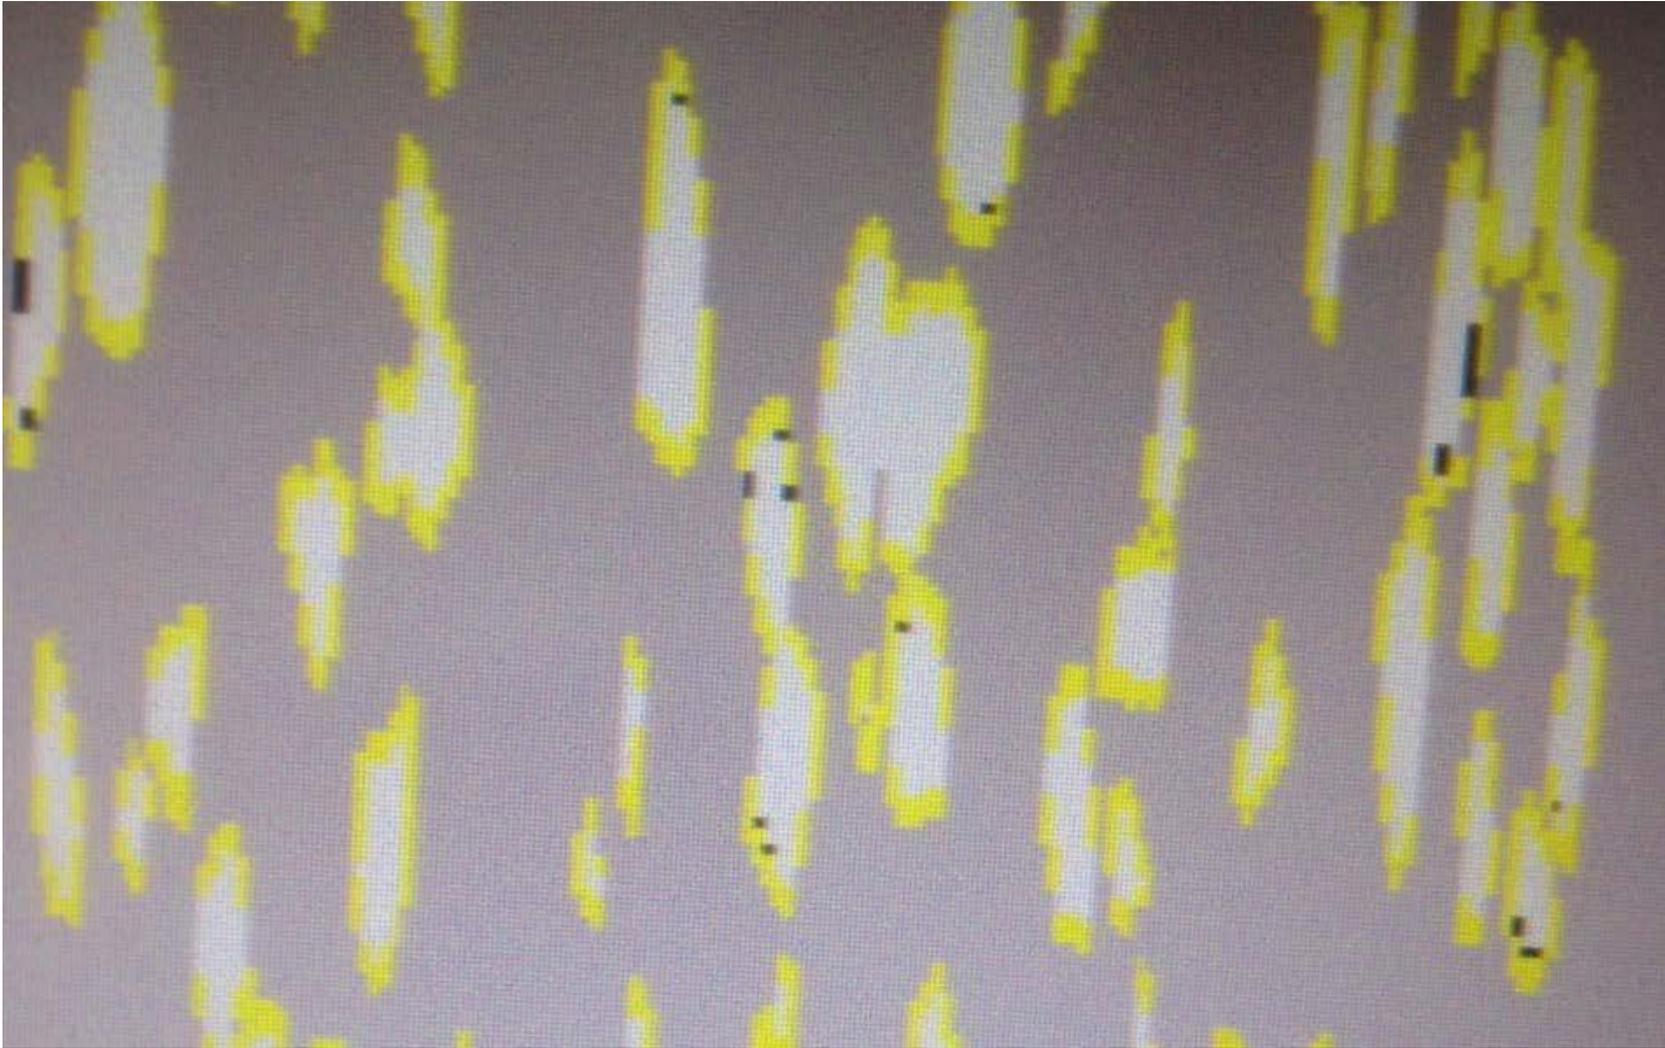

- Yet this hard waste rock does contain *some* gold. Pyrite is associated with the gold. Trials at TOMRA's test facility indicated that an XRT sorter could identify and recover rocks containing pyrite.

# Actual Screen Shot of Sorter's X-Ray Imaging

# There's Gold in Them Thar Hills!

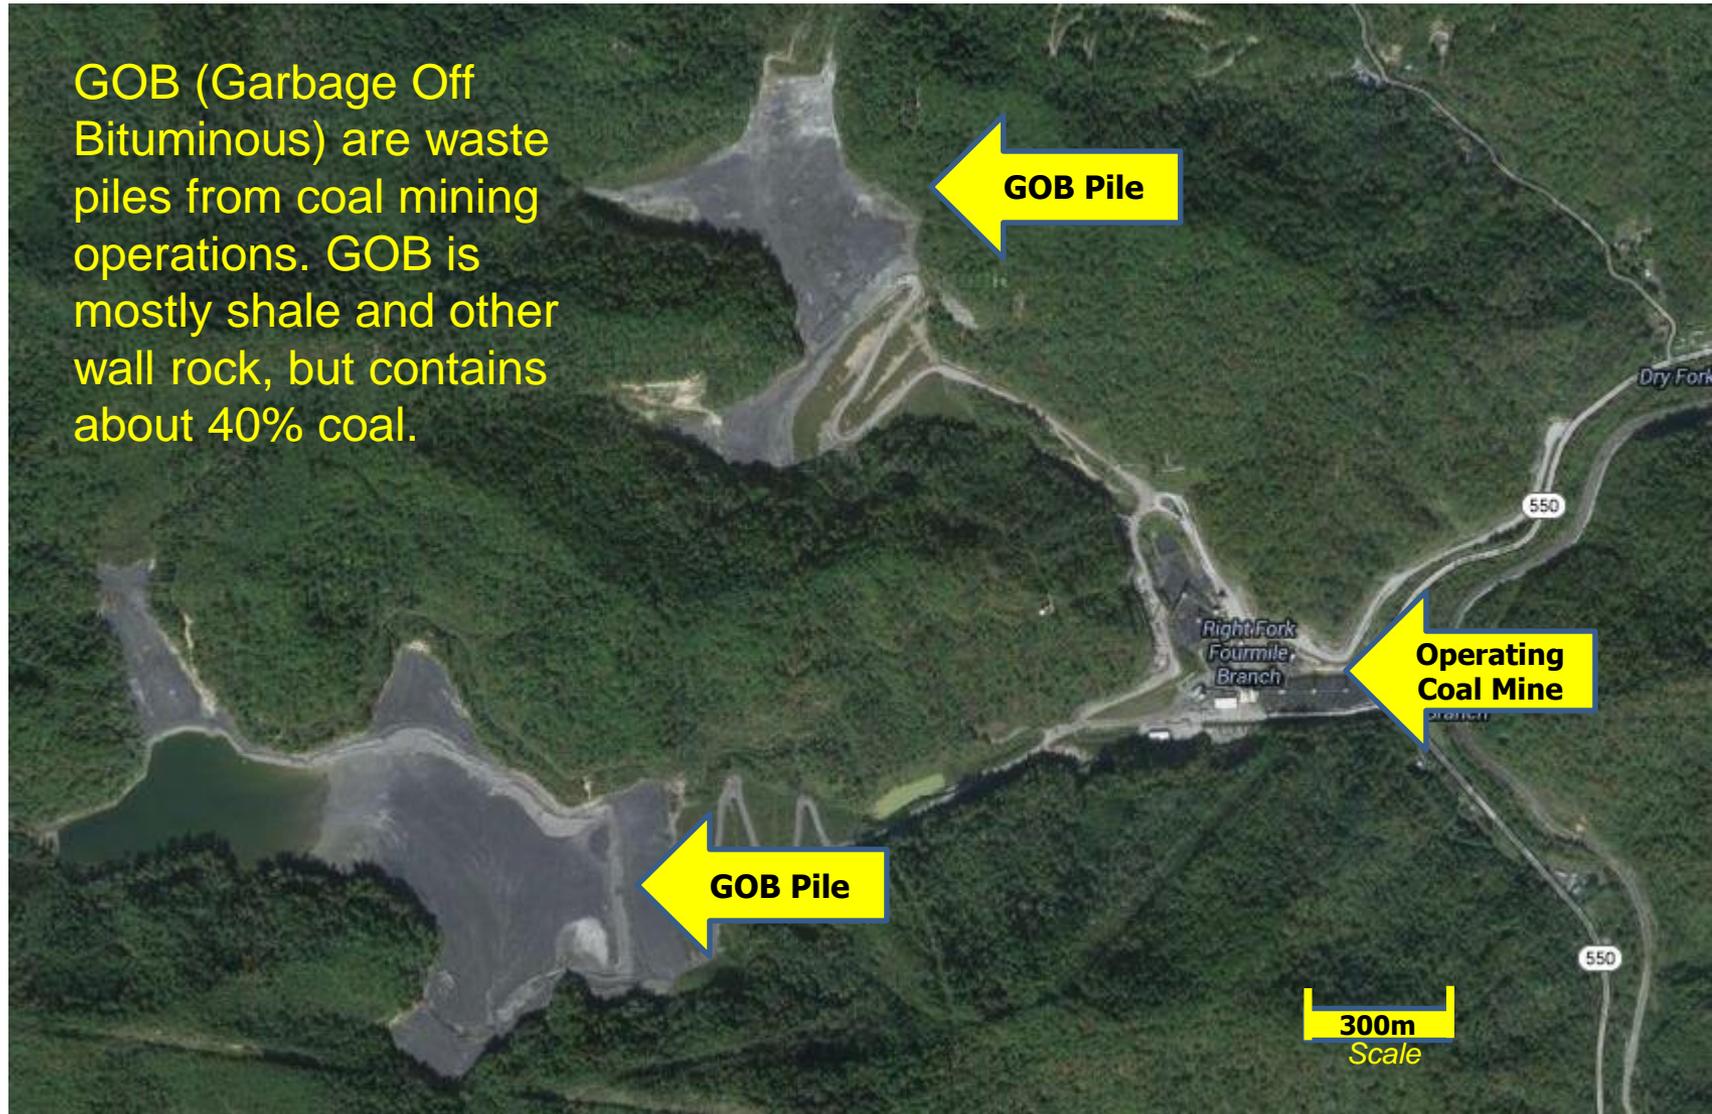

The TOMRA XRT1200 sorter delivers high grade ore to the processing plant and has resulted in an increase in gold production of 14 ounces per shift, or about \$2,000 per hour.

# Recovering Good Coal from "Garbage"

GOB (Garbage Off Bituminous) are waste piles from coal mining operations. GOB is mostly shale and other wall rock, but contains about 40% coal.
